We have a tool using `resolve1ib` which implements the `AbstractProvider` interface. 0.5.5 broke the API with `915363f` changing the signature of `identify`.

Following semver, technically such changes are to be expected, but I also saw `#74` warning about upcoming API breakage in 0.6.0, so I'm wondering what the policy around API changes is in `resolve1ib`.

uranusjr commented on 9 Mar 2021

I accidentally released the wrong branch (master) with the kwarg change 😞 I realised it just now as well (I'm pulling in changes in `pypa/pip#9699`).

My rule around versioning for now is to do breaking changes in the second digit (minor version), at least until 1.0 is reached. I think I'll just yank 0.5.5. Thanks for the report!

Motivation

Challenges

Dynamic Language Features

- Programming behaviors at runtime
- Dynamic type system with duck-typing

Complex API References

- Importing and renaming
- Same API but different names

Fake Private Members

- Fuzzy API accessibility / visibility
- Custom naming-conventions in case of aliasing

Flexible Argument Passing

- Required or optional parameters
- Positional, keyword, or variadic parameters

```
from os import path
from data import _store as write

class A:
    def __init__(self):
        self._x = 0
        self.bound = 10

    @property
    def x(self): return self._x
    @x.setter
    def x(self, val: "int"): self._x = val

    def __iter__(self) -> "Optional[A]": return self

    def __next__(self):
        if self.x < self.bound:
            self.x += 1
            return self.x
        else:
            raise StopIteration

def test(pos, /, posOrKw, *args, kw = None, **kwargs):
    print(pos, posOrKw, kw, args, kwargs)
```

from data import _store as write
```

```
class A:
    def __init__(self):
        self._x = 0
        self.bound = 10
```

Developers' convention, but still accessible for clients

```
@property
def x(self): return self._x
@x.setter
def x(self, val: "int"): self._x = val

def __iter__(self) -> "Optional[A]": return self

def __next__(self):
    if self.x < self.bound:
        self.x += 1
        return self.x
    else:
        raise StopIteration
```

```
def test(pos, /, posOrKw, *args, kw = None, **kwargs):
    print(pos, posOrKw, kw, args, kwargs)
```

AexPy's Approach Grading

Weak constraints on Python APIs

Difficulty on restricting client usage

Lack of compilation checking

The screenshot shows a GitHub issue titled "New matplotlib breaking change #1172" with a "Closed" status. The issue was opened by mmourafiq on 20 Nov 2020. A comment from mmourafiq describes a bug with a traceback. The traceback shows an `AttributeError` in `mpl3/mplexporter/exporter.py` at line 118, where `ax._gridOnMajor` is accessed. A green callout box explains that upstream `_gridOnMajor` is private, making the change compatible. A yellow callout box explains that downstream the attribute can be accessed normally, making the change breaking. The error message in the traceback is: `AttributeError: 'XAxis' object has no attribute '_gridOnMajor'`. Related issues and fixes are also listed.

Describe the bug

```
Traceback (most recent call last):
  File "/usr/local/lib/python3.6/dist-packages/plotly/matplotlib/mplexporter/exporter.py", line 118, in crawl_fig
```

Upstream `_gridOnMajor` is private, since its name starts with “_”, so the change is **compatible**.

Downstream the attribute can be accessed just like normal members, so the change is **breaking**.

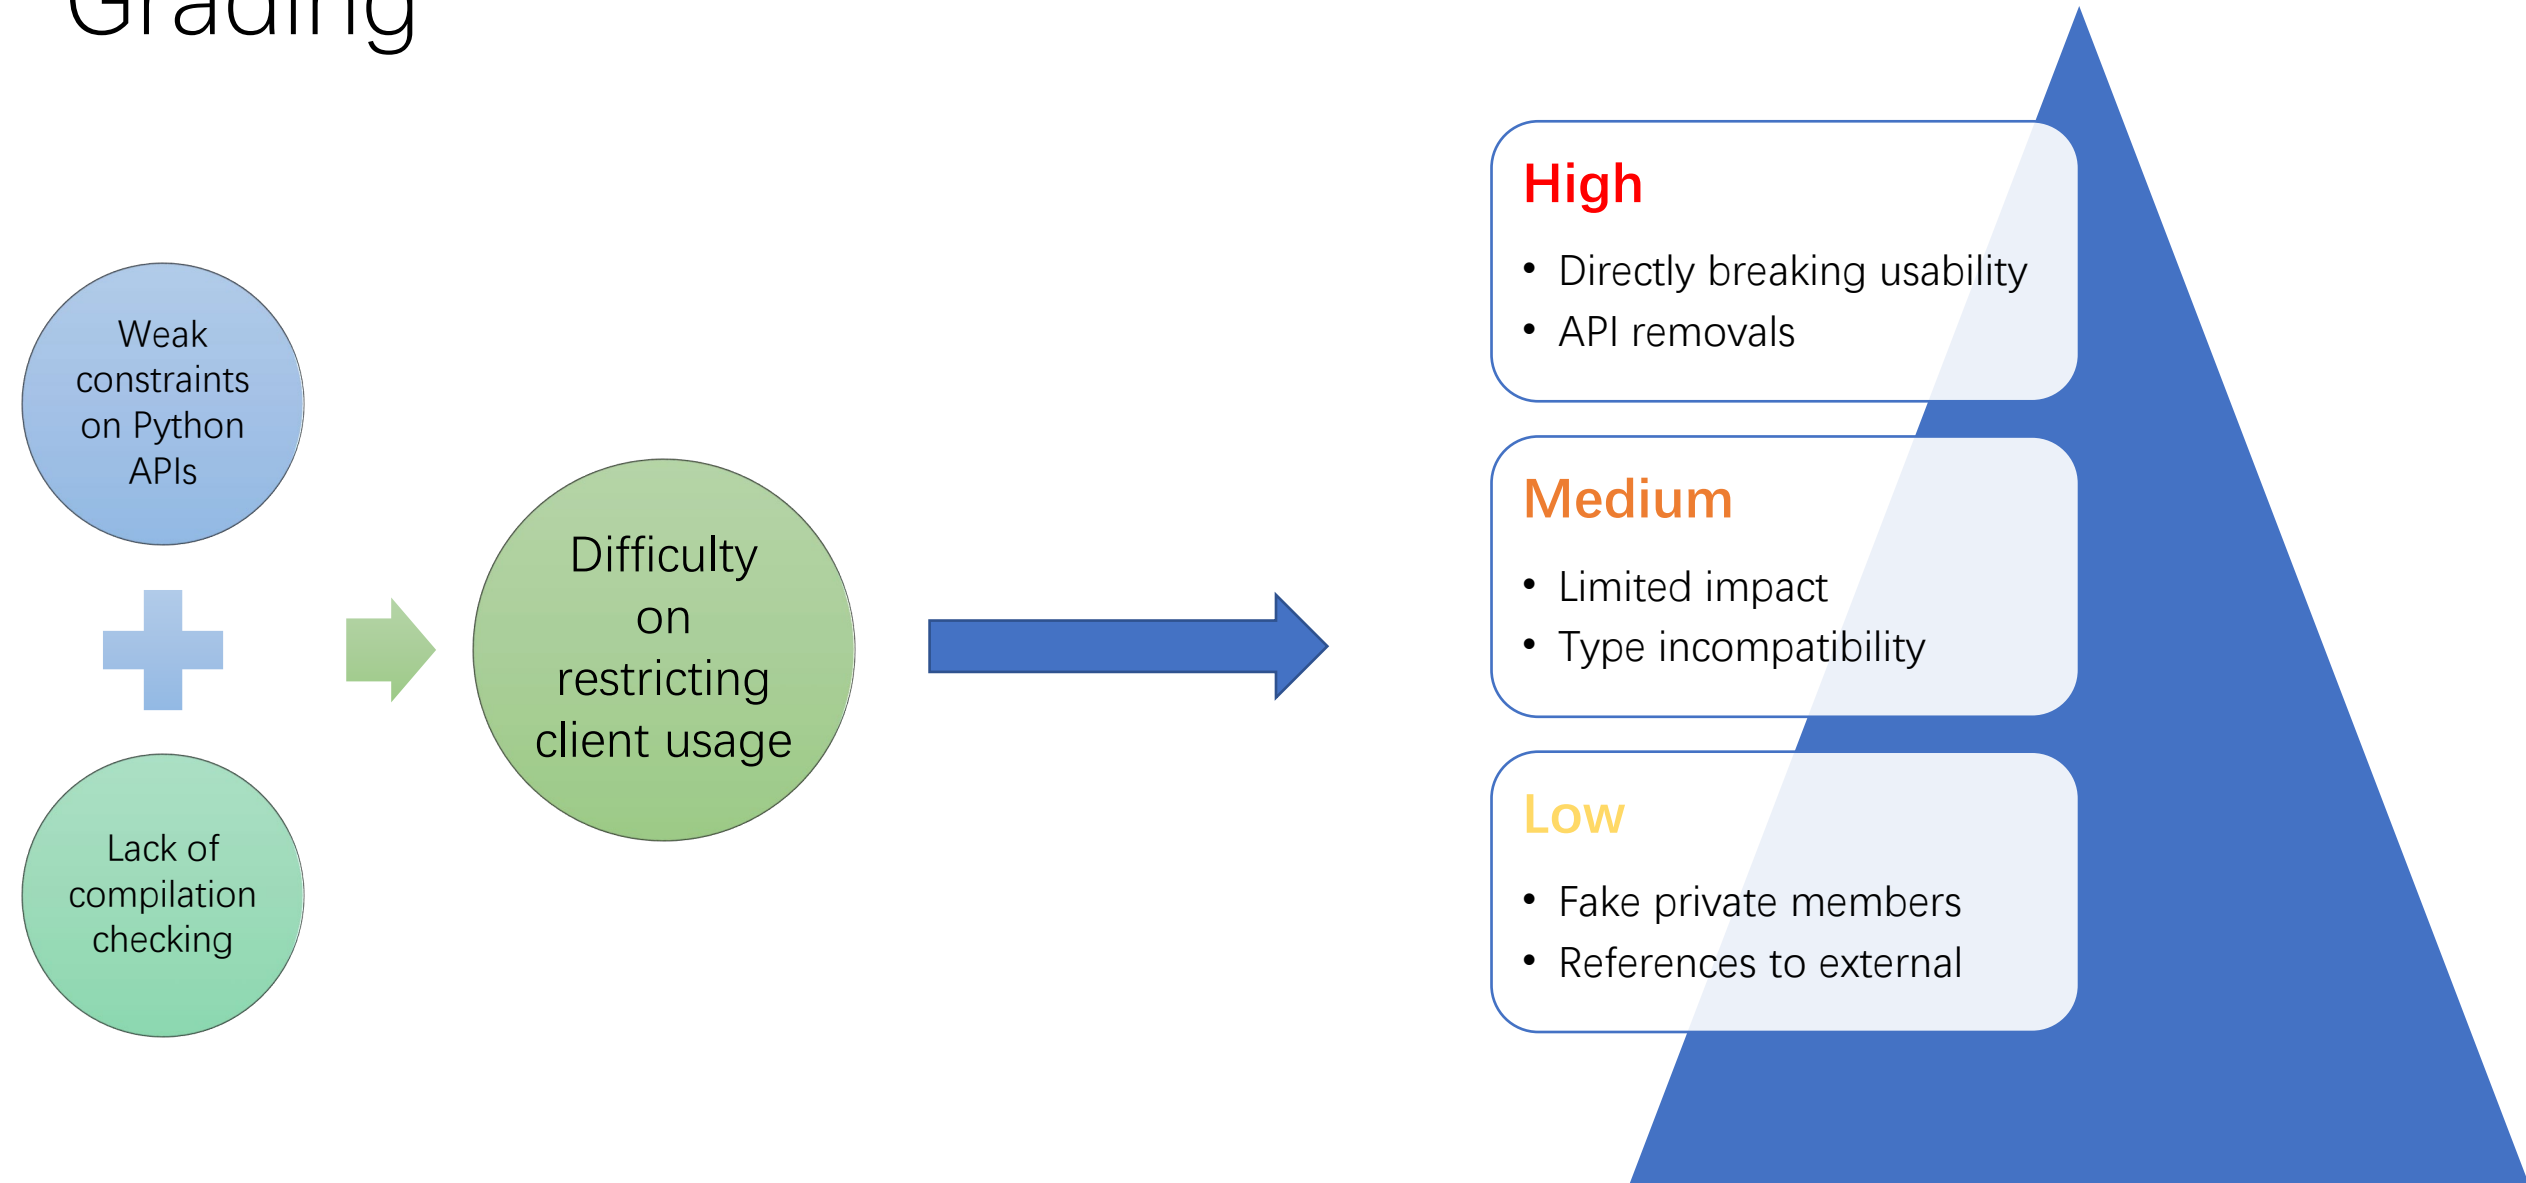

```
AttributeError: 'XAxis' object has no attribute '_gridOnMajor'
```

An API misuse detector with its own **change detector**

A **semantic versioning checker** for Python packages

Evaluation

Does AexPy detect more known breaking changes than existing approaches?

RESULTS ON 61 KNOWN BREAKING CHANGES

■ Module ■ Class ■ Function ■ Attribute ■ Parameter ■ Alias ■ Type ■ Crashed ■ No-Report

AexPy detects **53** changes, increasing by **~50%** recall.

Evaluation

Does AexPy detect more known breaking changes than existing approaches?

RESULTS ON 48 NON-CRASH KNOWN BREAKING CHANGES

■ Module ■ Class ■ Function ■ Attribute ■ Parameter ■ Alias ■ Type ■ No-Report

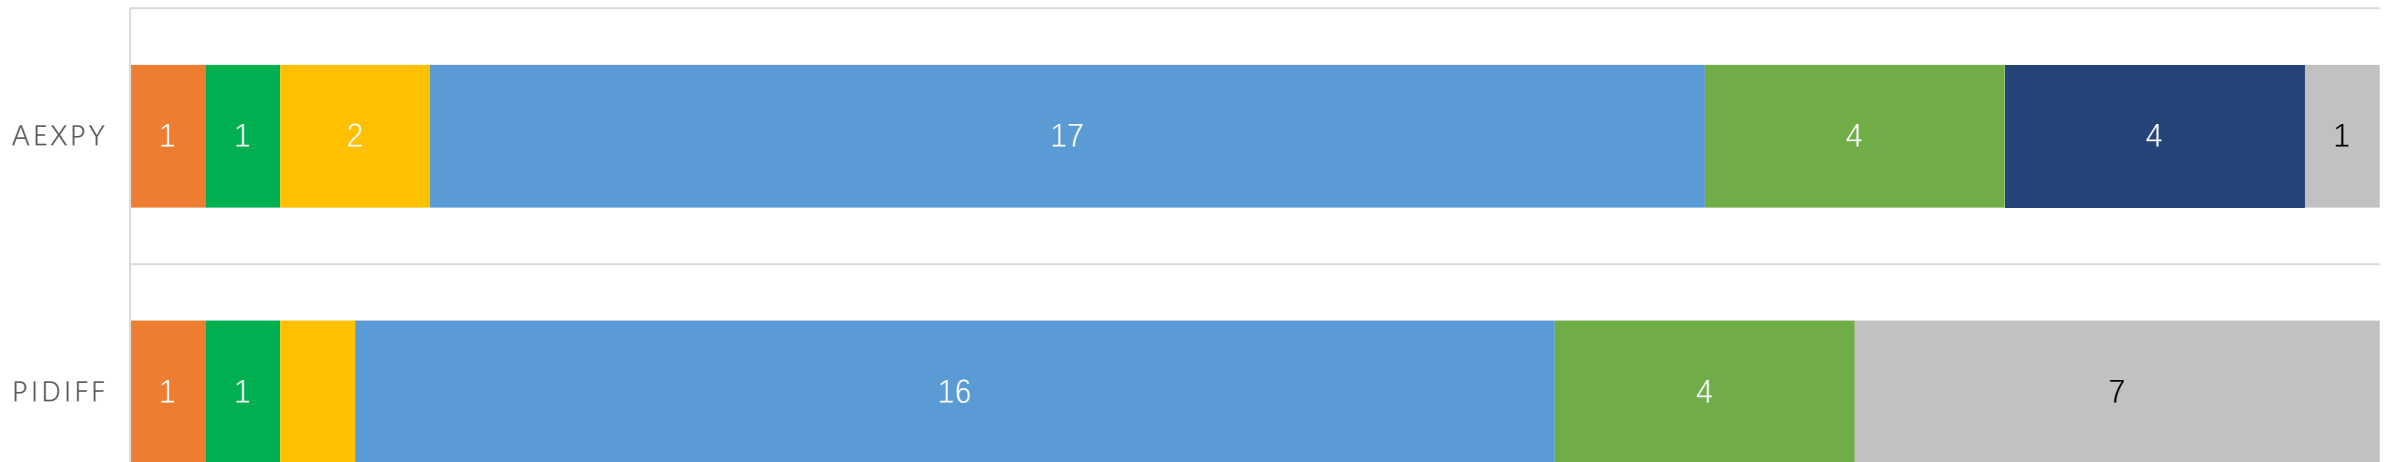

Both AexPy and PyCompat are not crashed,
AexPy detects **23** changes more.

Evaluation

Does AexPy detect more known breaking changes than existing approaches?

RESULTS ON 30 NON-CRASH KNOWN BREAKING CHANGES

■ Module ■ Class ■ Function ■ Attribute ■ Parameter ■ Alias ■ Type ■ No-Report

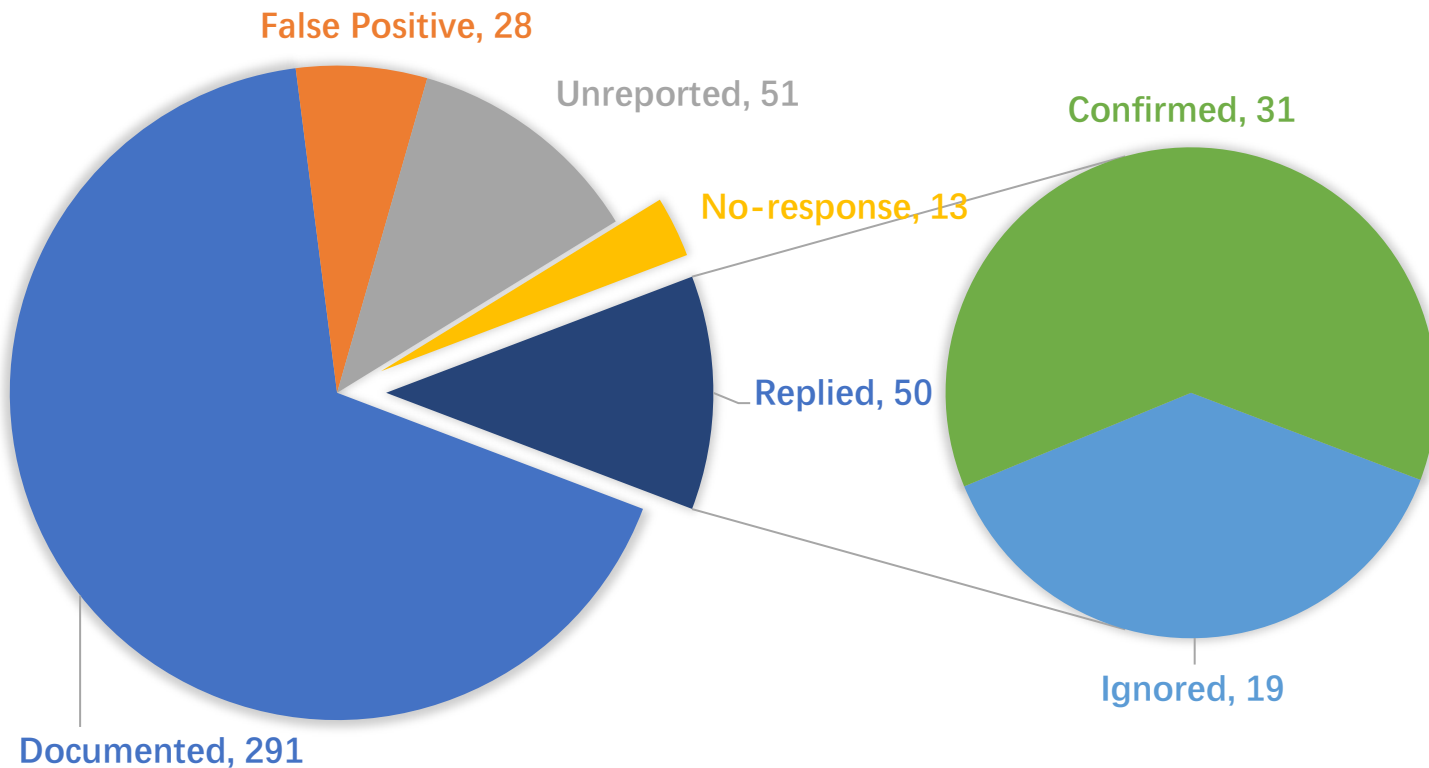

Both AexPy and Pidiff are not crashed, AexPy detects **6** changes more.

Evaluation

Can AexPy find potential unknown breaking changes?

RESULTS FOR HIGH/MEDIUM CHANGES ON LATEST VERSIONS OF 45 PACKAGES

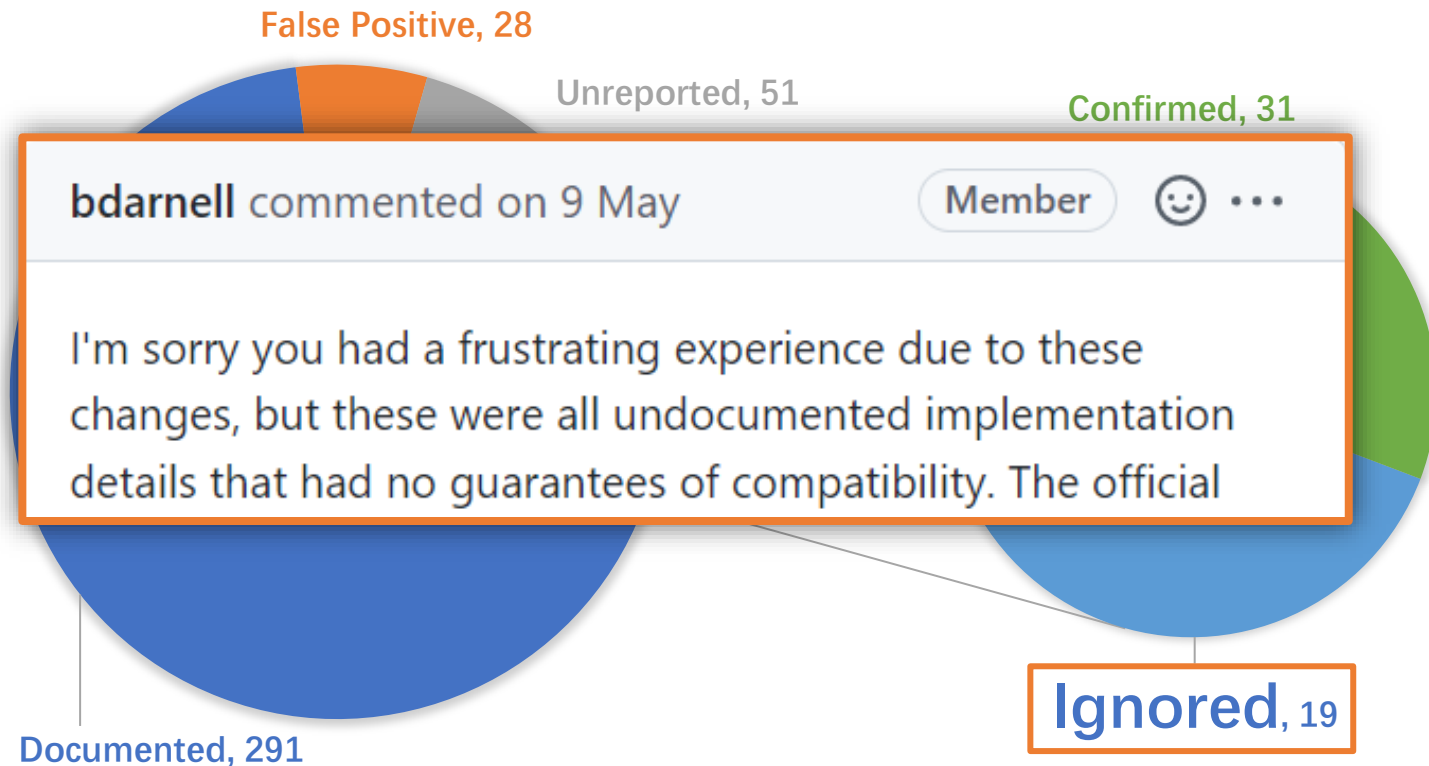

AexPy detects 433 high/medium changes, **405** are true.

Among 63 reported potential changes, **31** are confirmed by developers.

Evaluation

Can AexPy find potential unknown breaking changes?

RESULTS FOR HIGH/MEDIUM CHANGES ON LATEST VERSIONS OF 45 PACKAGES

AexPy detects 433 high/medium changes, **405** are true.

Among 63 reported potential changes, **31** are confirmed by developers.

Evaluation

What is the time performance of AexPy?

Average Time (second) on 45 Packages with Different LOCs

The time performances of the three tools are **in the same order of magnitude.**

Experiment Environment

Containers on a Ubuntu 18.04, 12 CPUs of 3.8GHz, 64 GBs RAM

Limited in 50GBs RAM, 1 hour, for each version pair

Contributions

AexPy: Detecting API Breaking Changes in Python Packages

An API breaking change detection approach for Python packages

- High recall and strong robustness
- Detecting potential breaking changes
- Comparable time performance

Key ideas

- Detailed model for APIs, changes, and breaking levels
- Hybrid analysis to enhance API extraction
- Constraint-based method to detect and grade API changes

Future works

- Study more applications of the built API and change knowledge base
- Consider more aspects of breaking changes including API semantics
